BALEMAX™

HAY PRESERVATIVE

“SAVES A LOT OF TIME AND FUEL WHEN GRINDING THE TREATED BALES.”

LARRY GOEBEL - LEBANON, SD

DAN LEMLER - GETTYSBURG, SD

“We baled our alfalfa at 28% moisture. Three bales were left untreated. Five weeks after baling, the bales were cut open, and we saw an amazing difference. The bales treated with **BaleMax**™ were nice and green and smelled good. The untreated bales were still hot, a dark brown color like tobacco and stunk. We sent in samples to Midwest Labs and the treated relative feed value (RFV) was 167 while untreated RFV was 126. The treated bales were also 4 points higher in crude protein. The treated bales grind so much easier and the cows clean it all up.”

“RAIN WAS ON THE WAY, SO WE WENT OUT AND BALED HAY AT A HIGHER MOISTURE THAN WE SHOULD HAVE BECAUSE WE HAD BALEMAX™”

KEITH SUGLA - GONVICK, MN

LARRY GOEBEL - LEBANON, SD “Alfalfa bales treated with **BaleMax**™ ground so much easier and were a lot greener. It’s hard to keep the grinder full when grinding treated bales. I was having to wait for the untreated bales to grind. Saves a lot of time and fuel when grinding the treated bales. We’ve used the product for 5 years now and it does not corrode our baler like other inoculants have in the past.”

TODD MANGIN - GETTYSBURG, SD “Treated bales are so much greener when I roll them out or grind them, and grind way easier. Great product that doesn’t rust my baler. The applicator works great and is easy to use.”

BaleMax™ was applied to 18% moisture alfalfa in August. The bale was opened on November 17.

DAVID HOLUBEC - MELVIN, TX “‘Should I bale, or should I wait until the next day?’ With **BaleMax**™ you can confidently start baling high moisture hay, and have better quality hay.”

DALE BRYANT - SENECA, SD “I put an untreated bale in one bale feeder and an **BaleMax**™ treated bale in the other and just watched my cows. Within 20 minutes they were all around the treated bale. Everyday they ate the treated bale first. A month later I switched the bales around to see what they’d do. At first, they went to the bale feeder that usually had the Anchor treated bale in it, but now had the untreated bale. Within 15-20 minutes they were all around the other bale feeder with the **BaleMax**™ treated bale. The cows’ actions sold me on the product. It’s just higher quality hay.”
